Market Challenge

NGL production and ethane rejection estimates across the 11 U.S. regions that comprise EIA Refining Districts are necessary to buy and sell natural gas profitably. However, this data is hard to find in real time, and existing sources are often broad and inaccurate. Without timely, granular data, your NGL numbers can be long or short, creating too much supply sold below cost, or too much demand that can't be met.

How We Help

At less than half the cost of competitors, OPIS PointLogic's NGL Module provides real-time product disruptions by EIA refining district and by NGL product. Quickly access NGL production numbers by specific region to make buying & selling decisions based on your needs, rather than on macro-level considerations.

Benefits

- See production disruptions by EIA refining district and NGL product in real-time
- View daily net output volumes for more than 240 U.S. processing plants
- Use interactive charting for NGL production history, NGL frac spreads at Mont Belvieu and Conway, and ethane frac spreads at Mont Belvieu
- Chart the most active gas processing plants of the day by volume change
- Review and download total U.S. estimates for each NGL or drill into a specific region
