Market Challenge

To buy and sell natural gas profitably, producers and traders need to understand the needs and challenges of specific producing regions. Compiling wellhead and dry estimates on a larger scale is a waste of time and resources because it doesn't provide context. Unfortunately, such macro-level data is the kind most commonly available, in static PDF report format that ignores changing conditions and daily price fluctuations.

How We Help

OPIS PointLogic's Production Module offers granular data by specific producing area via a dynamic GUI unavailable elsewhere.

Benefits

- Identify trends within a basin or area with data breakdowns by producing area (cluster of counties) and shale vs. conventional production type.
- See a complete picture of trends within different geologic plays using state history data. View every active meter location – along with associated volume history – by pipeline, state or market area and filter by point type.
- Create pipeline and point watchlists that deliver email alerts based on volume percentage change intraday, daily or weekly.
- Click on any map point or meter to get more data on the point and chart historical volume trends.
